Taylor	Heuristic Violated		Description							Suggested Fix						
1	Consistency and Standards		Navigation bar used in both browser and tile screen functionality could cause confusion							Create either a brand new navigation bar thats suited for either tile screen, or browsing. Only have one bar situated in one location						
										to cause less confusion						
2	Aesthetic and Minimalist Design		Loading screen pops up on occasion and disrupts flow and look of system							Have a seemless transition between pages and not include a loading screen at all						
3	Flexability and efficiency of use		Buttons might be too small for intended users							Have functionality that allows larger button icons for easier use						
			The back, forward and refresh buttons might be too small/challenging for our users to press													
4	User control and freedom		If a mistake is made, for example on the list favourites page and a user click the wrong favourite							Build in functionality where going back between tile menu and browser functionality is allowed						
			they need to go back to the main tile screen, click favourites and then get back to the list													
5	Match between system and real world		No shortcuts when typing URL. Need to type in "https://..."							Create shortcuts like a regular browser where shorter URL addresses can be taken as input						
6	Visibilty of system status		When first brought to tile screen, the URL bar doesn't show anything causing confusion							Show a greyed out example of what a user could type so the user knows this bar is for URL searching						
			as to what this bar is useful or just a waste of space													
7	Help users recognize, diagnose,		If a user puts in a wrong URL (example: without https:// prefix) then ther is no error recovery							Create tutorial videos on how to use the system or better yet have error checking within the system to catch and report						
	and recover from errors		or dialogue to inform user of the error							these errors to the users
